(54) Title: PATIENT ACTIVITY MONITOR

(57) Abstract: A patient activity monitoring system that allows caregivers of multiple patients to work more efficiently and with less error, while increasing the quality and level of patient care. The system includes a plurality of remote monitoring subsystems, each with a remote monitoring unit, a user notification unit, and a central monitoring unit with a Graphical User Interface (GUI) communicably coupled between the remote monitoring and user notification units. Each remote monitoring subsystem includes a remote monitoring unit, and a sensor device associated with a respective patient that detects one or more activity and/or physiological parameters of the patient. A simplified user interface including the GUI and the user notification units provides indications of the type and level of assistance required by one or more patients to caregivers at centralized and remote locations.
